6. Set your own location in emulator	14
7. Images / Icons	15
8. Material You Need to Submit.....	15

1. Objectives

- Become familiar with the Swift language, Xcode and iOS App development.
- Practice the Model-View-Controller design pattern.
- Build a good-looking iOS app.
- Learn to integrate APIs and iOS SDK
- Manage and use third-party libraries by CocoaPods

2. Background

2.1 Xcode

Xcode is an integrated development environment (IDE) containing a suite of software development tools developed by Apple for developing software for macOS and iOS. First released in 2003, the latest stable release is version 13.0 and is available via the Mac App Store free of charge.

Features:

- Swift 5 support
- Playgrounds
- Interface Builder
- Device simulator and testing
- User Interface Testing
- Code Coverage

The Official homepage of the Xcode is located at:

<https://developer.apple.com/xcode/>

2.2 iOS

iOS (originally iPhone OS) is a mobile operating system created and developed by Apple Inc. and distributed exclusively for Apple hardware. It is the operating system that presently powers many of the company's mobile devices, including the iPhone, iPad, and iPod touch. It is the second most popular mobile operating system in the world by sales, after Android.

The Official iOS home page is located at:

<http://www.apple.com/iOS/>

The Official iOS Developer homepage is located at:

<https://developer.apple.com/ios/>

2.3 Swift

Swift is a general-purpose, multi-paradigm, compiled programming language created for iOS, macOS, watchOS, tvOS and Linux development by Apple Inc. Swift is designed to work with Apple's Cocoa and Cocoa Touch frameworks and the large body of existing Objective-C code written for Apple products. Swift is intended to be more resilient to erroneous code ("safer") than Objective-C and also more concise. It is built with the LLVM compiler framework included in Xcode 6 and later and uses the Objective-C runtime, which allows C, Objective-C, C++ and Swift code to run within a single program.

The Official Swift homepage is located at:

<https://developer.apple.com/swift/>

2.4 Google App Engine (GAE)

Google App Engine applications are easy to create, easy to maintain, and easy to scale as your traffic and data storage needs change. With App Engine, there are no servers to maintain. You simply upload your application and it's ready to go. App Engine applications automatically scale based on incoming traffic. Load balancing, micro services, authorization, SQL and noSQL databases, memcache, traffic splitting, logging, search, versioning, roll out and roll backs, and security scanning are all supported natively and are highly customizable.

To learn more about GAE support for Node.js visit this page:

<https://cloud.google.com/appengine/docs/standard/nodejs/>

3. Prerequisites

This homework requires the use of the following components:

3.1 Download and install Xcode

To develop iOS apps using the latest technologies described in these lessons, you need a Mac computer (macOS Sierra 10.12.4 or later) running the Xcode (10.x or later). Xcode includes all the features you need to design, develop, and debug an app. Xcode also contains the iOS SDK, which extends Xcode to include the tools, compilers, and frameworks you need specifically for iOS development.

For HW-9, Xcode version 10.x or later can be used.

Xcode version 13.0 is strongly recommended. It can be downloaded from the following link:

<https://developer.apple.com/download/more/?name=Xcode>

You may use any other IDE other than Xcode, but you will be on your own if problems come up.

Swift above 5.x is strongly recommended to use for this app.

3.2 Add your account to Xcode

When you add your Apple ID to the Xcode Accounts preferences, Xcode displays all the teams you belong to. Xcode also shows your role on the team and details about your signing identities

and provisioning profiles that you'll create later in this document. If you don't belong to the Apple Developer Program, a personal team appears.

Here is detailed documentation:

<https://developer.apple.com/library/iOS/documentation/IDEs/Conceptual/AppStoreDistributionTutorial/AddingYourAccounttoXcode/AddingYourAccounttoXcode.html>

3.3 Install CocoaPods

CocoaPods is a dependency manager for Swift and Objective-C Cocoa projects. It has over ten thousand libraries and can help you scale your projects elegantly. You can install dependencies using it, we will need to install many third-party modules and frameworks using it.

CocoaPods is built with Ruby and is installable with the default Ruby available on macOS. We recommend you use the default Ruby. Using the default Ruby install can require you to use 'sudo' when installing gems.

Run the command below in your Mac terminal:

```
$ sudo gem install cocoapods
```

Once you have created your Xcode project, you can start to integrate CocoaPods into your project.

Further guides on how to integrate CocoaPods are available at: <https://cocoapods.org/>.

The following pods will be needed:

- [SwiftJSON](#): To handle JSON data.
- [Alamofire](#): To make HTTP requests.
- [Toast-Swift](#): To display toast messages in your app
- [SwiftSpinner](#): For the big loading spinner.
- [HighCharts](#) ~> 9.2.2 : For implementing charts on weekly and data Tab.

3.4 Alternative to CocoaPods -> Swift Package Manager

To add dependencies to your Swift without worrying about PodFiles you can also use Swift Package Manager.

In Toolbar, click File – Swift Packages – Add Package Dependency for adding all packages. Then add git repo link to add dependency.

The following urls will be needed to add:

- <https://github.com/SwiftyJSON/SwiftyJSON>: To handle JSON data.
- <https://github.com/Alamofire/Alamofire.git>: To make HTTP requests.
- <https://github.com/scalessec/Toast-Swift>: To display toast messages in your app
- <https://github.com/icanzilb/SwiftSpinner>: For the big loading spinner.
- <https://github.com/highcharts/highcharts-ios.git>: For implementing charts.

4. High Level Design

This homework is a mobile app version of Homework 8. In this exercise, you will develop an iOS Mobile application, which allows users to search for weather details using the Tomorrow.io APIs and add locations in favorite list, and post on Twitter. You should reuse the backend service (node.js script) you developed in HW8 and follow the same API call requirements.

The main scene of this app is like that in Figure 1. The launch screen of the App is shown in Figure 1.1. All the implementation details and requirements will be explained in the following sections.

Figure 1: Weather App

Figure 1.1: Launch Screen

5. Implementation

5.1 Initial View

You must replicate the Initial View as shown in Figure 1. It should **always** display the weather details of the **Current location** automatically.

The interface consists of the following:

- **Search Bar:** A 'UISearchBar' component allowing the user to enter the **city** name. While typing in the search bar, the results should be provided using the autocomplete API. Make sure you use the same API as Homework 8. (Hint: The results can be shown as a 'UITableView' which is hidden/shown according to the response of the autocomplete API).

Figure 2: AutoComplete for Search

5.1.1 First Sub View

The first sub view consists of weather Icon according to the Weather Code from API, temperature, City Name and weather text according to weather code (Figure 3). The entire view needs to be clickable. On Clicking anywhere on the sub view, user should be navigated to the details page.

Figure 3: First Sub View

5.1.2 Second Sub View

The second sub view consists of 4 (Humidity, windspeed, visibility and pressureSeaLevel) fixed weather properties as shown in (Figure 4).

Figure 4: Second Sub View

5.1.3 Third Sub View

Third sub view is a scrollable UITableView, with each cell displaying the data for next 7 days. Including today's date. The data consists of the date, weather icon, sunrise time, sunrise icon, sunset time and sunset icon. Note that the time is according to **PST** time zone.

10/29/2021		07:08		18:03	
10/30/2021		07:11		18:01	
10/31/2021		07:11		18:01	
11/01/2021		07:11		18:00	
11/02/2021		07:13		18:00	
11/03/2021		07:13		17:58	

Figure 5: Third Sub View

5.1.4 Current Location

To obtain the current location, standard location service provided by apple should be used. More details on standard location service can be found here:

https://developer.apple.com/documentation/corelocation/getting_the_user_s_location/using_the_standard_location_service

5.2 Search Results Page

When the user taps any of the city from the autocomplete result, your app should display a *big spinner* (Hint: using `SwiftSpinner`)(Figure 6) before it's ready to show the search results page. Then after it gets data from your backend, it should hide the spinner and display the result page with exactly the same layout as the initial page, shown in Figure 7.

Figure 6: Display a big spinner while searching

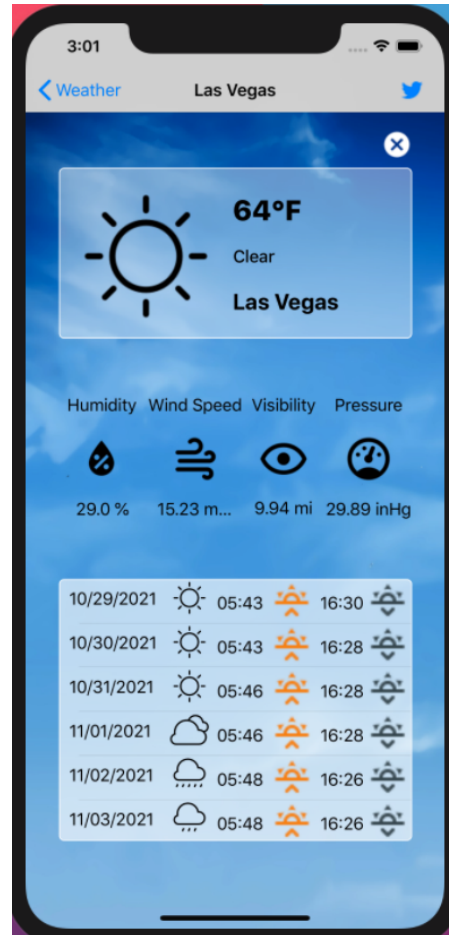

Figure 7: Search Result Page

5.2.1 Twitter Button

Share button (Twitter icon) to share the weather details on Twitter. Once the button is tapped, a web page should be opened (in Safari or your default browser for your emulator) to allow the user to share the weather information on Twitter, as shown in Figure 8.

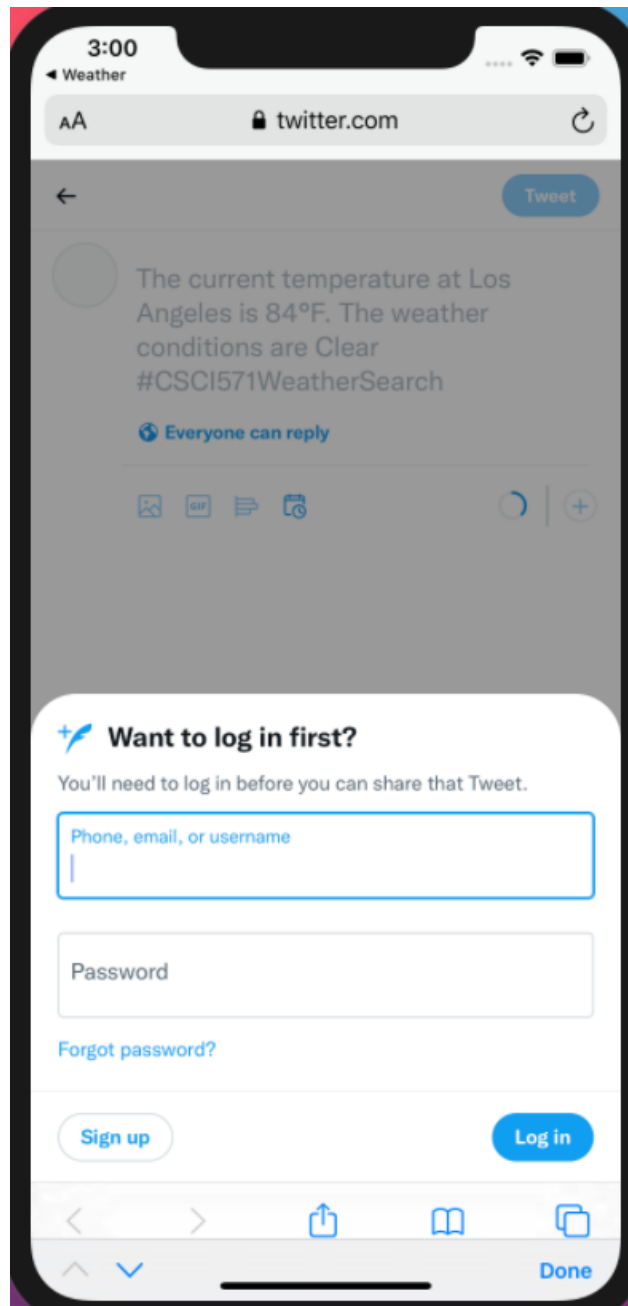

Figure 8: Twitter Button

5.2.2 Favorite's button

Tapping the Favorite button (the + button) would add the corresponding Weather city into the Favorite list. A message should be displayed at the bottom of the app and the Favorite button should be changed to 'x' button, as shown in Figure 9. Tapping that button again would remove that city from the favorite list, and a similar message should also be displayed to indicate that the city has been removed from favorite list and the button is changed back to '+' button as shown in the video.

Figure 9: Message on removing the city to fav list

The state of the fav button should be consistent i.e. If the user searches for a city that is already in the fav list, then on search results page, the state of the favorite button should be ('x') not ('+').

5.3 Weather Details

Tapping on the first sub view in the should show weather details with three tabs named as: **Today**, **Weekly** and **Weather Data** (Figure 10).

All the three tabs share the same **Navigation Bar on the top**. The navigation bar should include the following elements:

- **Back button** which navigates back to the search results page.

- **Twitter button**
- **City Name** as Title of the header.

5.3.1 Today Tab

The today tab contains a collection view having 9 items as shown in figure 10. Each Item has corresponding icon, property name and its value with units.

Figure 10: Today Tab

5.3.2 Weekly Tab

Weekly Tab consists of the following:

1. Weekly Weather Summary View having the weather text according to the weather code and the corresponding icon with current temperature displayed on it.
2. An Area Chart showing minimum and maximum temperature trend for next 15 days from current date (including current date). You will be using HighCharts pod (mentioned in 3.3)

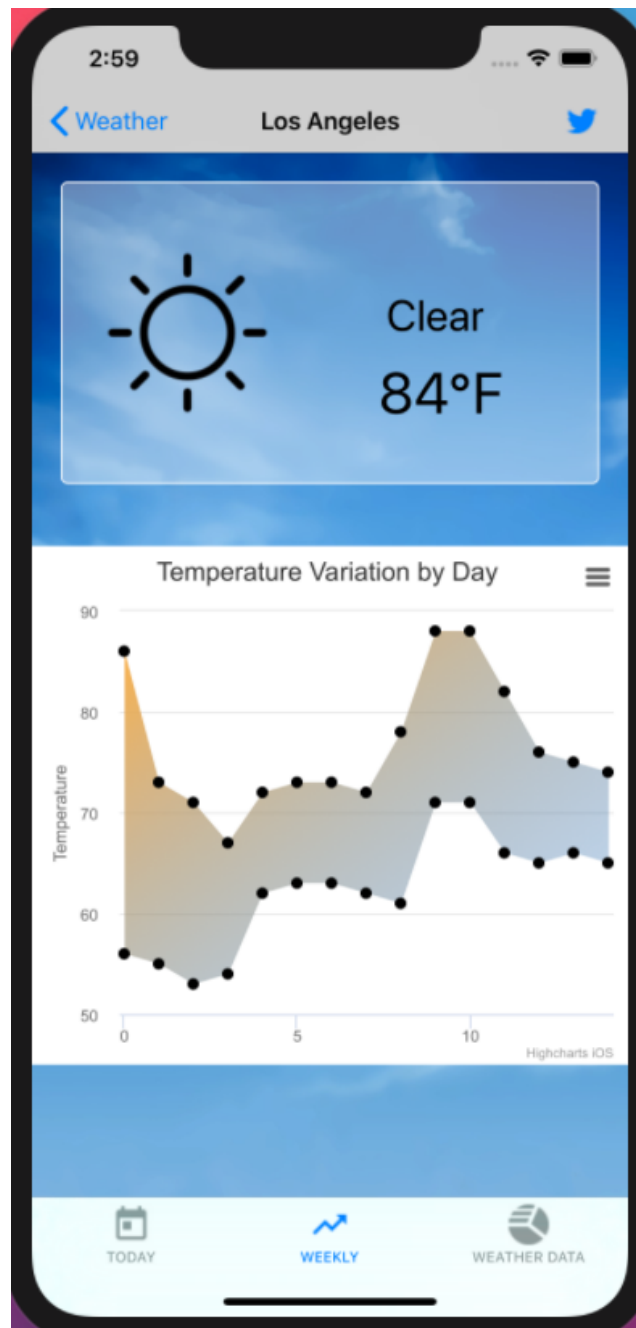

Figure 11: Weekly Tab

5.3.3 Weather Data Tab

Weather Data Tab consists of the following:

1. Key Data Summary View having 3 data displayed. precipitationProbability, humidity and cloudCover with the icons displayed which are same as Today tab.
2. An **Activity gauge** chart from HighCharts pods. Which will contain the percentage value of precipitationProbability, humidity and cloudCover with 3 different gauges.

You can find more info about different charts in HighCharts pods here:

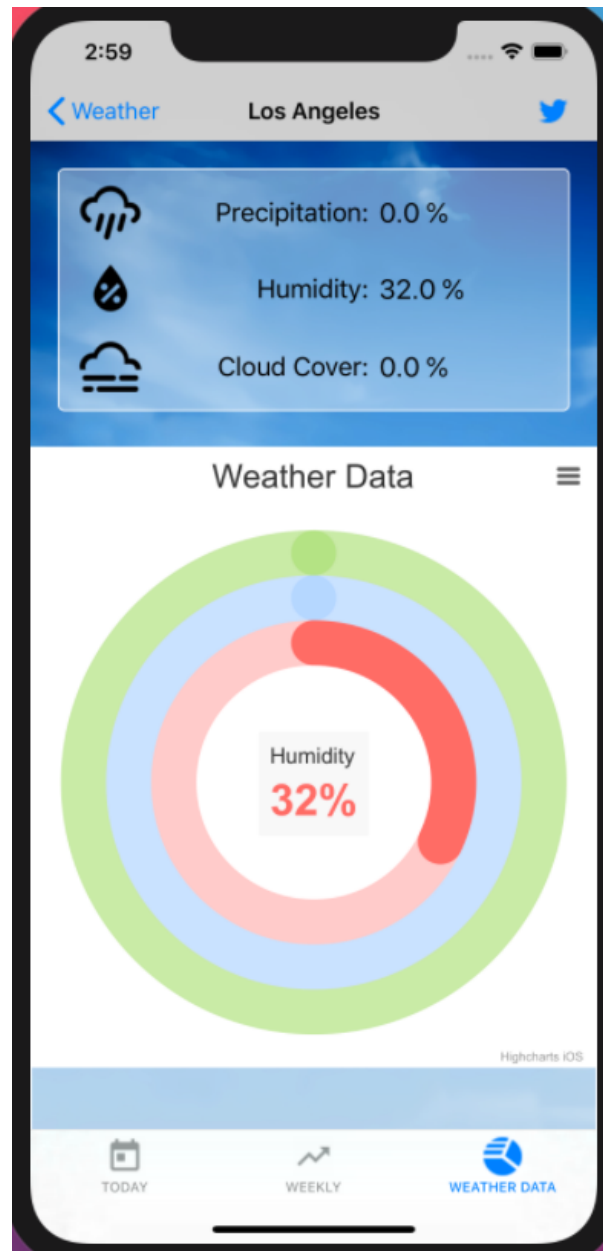

Figure 12: Google Photos Tab

5.4 Favorite List Implementation

Use **UIPageControl** and **UIScrollView** in the initial view to display the weather details of the cities adding the favorite list.

Use **UserDefaults** to store favorite List data.

<https://developer.apple.com/documentation/foundation/userdefaults>

Key Points to note:

1. The favorite list should persist even after closing the app. The items should be removed from fav list only if the user removes them.
2. You may need to pass data between different views. You can refer this link to learn about data passing between Views in Swift : <https://learnappmaking.com/pass-data-between-view-controllers-swift-how-to/> .
3. The horizontal scroll of the views should replicate exactly as shown in the video

5.5 Additional Info

For things not specified in the document, grading guideline, piazza, or the video, you can make your own decisions. But keep the following points in mind:

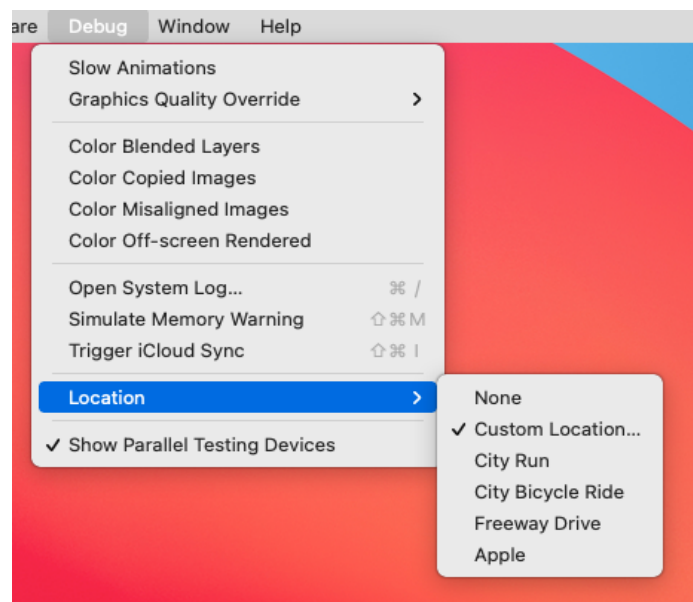

- Always display a proper message and don't crash the app, if an error occurs.
- You can only make HTTP requests to your backend (Node.js script on AWS/GAE/Azure)
- All HTTP requests should be asynchronous.

6. Set your own location in emulator

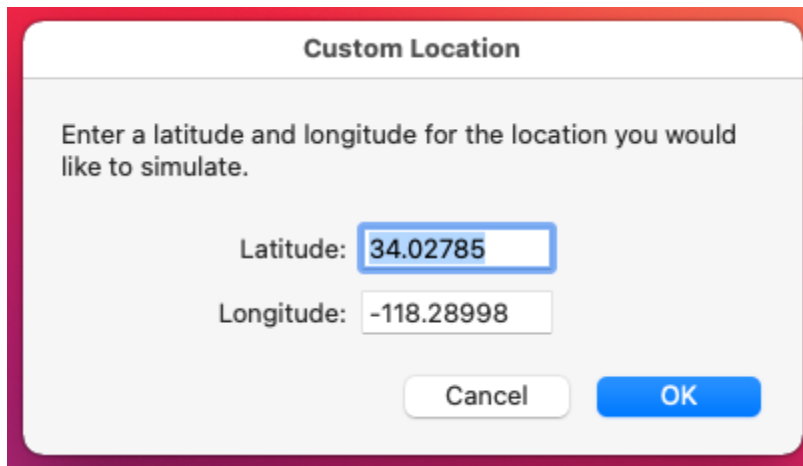

Follow these steps to add your own location inside your emulator as it defaults to some fixed points around the world.

Step 1: Open your emulator.

Step 2: Go to Debug – Location – Custom Location

Step 3: Set your location using Latitude and Longitude.

A dialog box titled "Custom Location" with a light gray background and a red border. It contains the text "Enter a latitude and longitude for the location you would like to simulate." Below this text are two input fields. The first field is labeled "Latitude:" and contains the value "34.02785". The second field is labeled "Longitude:" and contains the value "-118.28998". At the bottom right of the dialog box are two buttons: "Cancel" and "OK".

Custom Location

Enter a latitude and longitude for the location you would like to simulate.

Latitude: 34.02785

Longitude: -118.28998

Cancel OK

7. Images / Icons

All the icons and Images necessary for this assignment will be provided on DEN.

8. Material You Need to Submit

You should also ZIP all your source code (without image files and third-part modules) and submit the resulting ZIP file by the end of the demo day.

You will have to submit a video of your assignment demo. Details for that will be sent separately.

****IMPORTANT**:**

All videos are part of the homework description. All discussions and explanations in Piazza related to this homework are part of the homework description and will be accounted into grading. So please review all Piazza threads before finishing the assignment.
